

# Extracting Spatial Triplets From Place Descriptions

- Automated extraction of triplets from natural language text to represent spatial relationships e.g. *house in alley*
- **Goal** : Use of meta-information of the places to output triplets, informative and convenient enough for computational interpretation e.g. *three stories town house in alley*.
- Exploits a parser which identifies prepositional clauses(DLE) for a place name.
- **Challenges** : Spatial motion interpretation and reference resolution
